                                                                                                                           The present sequence is Pasteurella (Mannheimia) haemolytica modified leukotoxin-50 (lkt50) protein. The modification comprises the removal of amino acids within the hydrophobic transmembrane domain of a full length leukotoxin protein. Modified leukotoxin sequences are used in vaccines to treat or prevent diseases associated with leukotoxin, e.g., respiratory disease, and Mannheimia infection (particularly M. haemolytica infection). In addition, the vaccine
                                                                                                                                                                                                                                                                                                                                                             Claim 4; Fig 12;
                                                                                                                                                                                                                                                                                                                                                                                                                                  Modified leukotoxin polypeptide is useful in a vaccine to prevent or treat Mannheimia (Pasteurella) infection (particularly M. haemolytica infection), and disease associated with a leukotoxin, e.g., respirato
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to new Moraxella bovis antigens and nucleic acid sequences encoding these antigenic polypeptides. The antigenic polypeptides and polynucleotides are useful for raising an immune response in an animal directed against Moraxella, preferably against M. bovis or M. catarrhalis, and for treating Moraxella infections. The present sequence represents the amino acid sequence of the A subunit of

                                                                                                                                                                                                                                                                       The present sequence is Pasteurella (Mannheimia) haemolytica modified leukotoxin-66 (lkt66) protein. The modification comprises the removal of amino acids within the hydrophobic transmembrane domain of a full length leukotoxin protein. Modified leukotoxin sequences are used in vaccines to treat or prevent diseases associate with leukotoxin, e.g., respiratory disease, and Mannheimia infection (particularly M. haemolytica infection). In addition, the vaccine is used to prepare a medicament. Furthermore, the plant transformed with modified leukotoxin sequences is fed to an animal such as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modified leukotoxin polypeptide is useful in a vaccine to pitreat Mannheimia (Pasteurella) infection (particularly M. hi infection), and disease associated with a leukotoxin, e.g., % \left( \frac{1}{2}\right) =\frac{1}{2}\left( \frac{1}{2}\right)

The protein, designated "new leukotoxin" or "LKT 352" is 98% homologous to authentic leukotoxin. LKT 352 and pref. antigenic fragments of it, can be used in vaccines to protect cattle from respiratory diseases. They can also be used to produce antibodies for immunoaffinity purificn. of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 1991-000097/01.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The lppB gene protein was expressed in E. coli as a fusion to the Pasteurella haemolytica leukotoxin gene lktA coded for by plasmid pAA352. The llpB gene fragment was taken from pMS11. LppB can be used in vaccines for preventing or treating H. somnus infections, which cause thromboembolic meningo-encephalitis, septicaemia, arthritis and pneumonia in vertebrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Haemophilus somnus immunogenic proteins used in vaccines selected from haemin-binding protein, haemolysin, LppB and corresp.          and that had been boosted with a conc. culture supernatant of P. haemolytica to increase anti-leukotoxin antibody levels. Positive colonies were screened for their ability to produce leukotoxin by incubating cell lysates with bovine neutrophils and measuring the release of lactate dehydrogenase from the neutrophils. A 4kb fragment was obtd. Progressively larger clones were isolated by chromosome wakking to isolate full length recombinants of ca. 8kb.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       length leukotoxin at very low levels. The 3' end of the lktA gene of pAA345 was therefore ligated to StyI/BamHI digested pAA342 to yield pAA352 contg. the LKT352 sequence. The protein expressed from the vector can be used to prepare a subunit vaccine with other P. haemolytica antigens, e.g. fimbrial protein, plasmin receptor or 50K outer membrane protein. The vaccines can be used to protect cattle from respiratory diseases such as pneumonia, esp.
                                                                                                                   Gene libraries of P. haemolytica Al (strain B122) were constructed in lambda gtll and pUCl3. Resulting clones were used to transform E coll and individual colonies were pooled and screened for reaction with serum from a calf which had survived a P. haemolytica infection
                                                                                                                                                                                                 Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
      A vaccine comprising an outer membrane protein (OMP) extract of Haemophilus somnus enriched with iron regulated proteins is new. The vaccine pref. further comprises an immunogenic leukotoxin polypeptide, esp. an immunogenic Pasteurella haemolytica leukotox homologous to LKT352. Example 1.2 describes the prodn. of P. haemolytica recombinant leukotoxin from pAA352. Two expression constructs were made. One, pAA342, contained the 5'-AhAII fragment of the ltkA gene, while the other, pAA345, contained the entire lktA gene. pAA342 expressed a truncated leukotoxin at very low levels, while pAA345 expressed full length leukotoxin at very low levels. Therefore, the 3' end of the like page of the leukotoxin at very low levels. Therefore, the 3' end of the leukotoxin at very low levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              high levels and the other expressing the full length leukotoxin at low levels. The 3' end of the lktA gene from the full length clone was ligated to the truncated gene clone to yield plasmid phA352. The clone was used to produce chimeric proteins by gene fusion with an antigen coding sequence, e.g. the coding sequence of somatostatin, gonadotrophin releasing hormone or rotavirus viral protein 4, i.e. leukotoxin works as a carrier protein to bring about a larger leukotoxin works as a carrier protein to bring about a larger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              immune response than the antigen alone. Immunisation with the antigens can regulate growth rate, lactation and reproductive efficiency. See also AAR34546-8.

It is the product of plasmid pAA352 which carries a truncated lktA gene (AAT37179). A fusion protein (AAW03942) between LKT352 and a gonadotropin releasing hormone tetramer can be expressed in Escherichia coli. This is useful as a vaccine for fertility control, partic. immunological sterilisation of domestic or

                                                                                                                                                                                                                                                                  The present sequence represents a recombinantly produced or chemically synthesised leukotoxin 352 (LKT 352)polypeptide, derived from the lktA gene that is present in the plasmid phA352. This gene produces a truncated protein that has an estimated molecular weight of about 99 kDa and lacks the cytotoxic portion of the molecular. Thus this gene has a higher expression level than that of the full-length molecule. This can be used in the construction of a chimeric protein that comprises a leukotoxin polypeptide, several multimers, and a ORTH sequence. The

                                                                                                                                                                                                                                            leukotoxin polypeptide, several multimers, and a GnRH sequence. The chimeric protein can be used as a vaccine to help reduce the incidence of mammary tumours in a mammalian individual.
                                                                                                                                                                                                                                                                                                                                                                                                                     Chimeric protein of leukotoxin and gonadotropin releasing useful for, e.g. preparation of vaccines for reduction of of mammary tumours in mammals
                                                                                                                                                                                                                       Sequence

                                                                                                  В
                                                                                                                 Š
                                                                                                                                                                                Query Match
                                                                                                                                                                                                                releasing hormone (GnRH) gene were constructed on a Pharmacia Gene Assembler using standard phosporamidite chemistry. The oligonucleotides were annealed and ligated into vector pAA352 (contg. the Pateurella heamolytica leuko-toxin gene) which had been digested with BamHI. The ligated DNA was used to transform E. coli strain WH3000. Transformants contg. the oligonucleotide inserts were identified by restiction endonuclease mapping and the recombinant plasmid designated pAA502. The chimeric protein produced from the plasmid works to bring about a larger immune response than the antigen
                                                                                                                                                                                                                                                                                                                                   Immunological carrier system with enhanced immunogenicity comprises chimeric protein comprising leuco:toxin peptide homologous protein fused to antigen esp. somatostatin or gonadotropin releasing hormone
Somatostatin-leukotoxin gene

                                                                                                                                                                                                                                       Oligonucleotides contg. sequences from bovine Rotavirus viral protein 4 (VP-4) gene were constructed on a pharmacia Gene Assembler using standard phosporamidite chemistry. The oligonucleotides were annealed and ligated into vector paa352 (contg. the Pateurella heamolytica leuko-toxin gene) which had been digested with BamHI. The ligated DNA was used to transform E. coli strain MH3000. Transformants contg. the oligonucleotide inserts were identified by restiction endonuclease mapping and the recombinant plasmid designated paa501. The chimeric protein produced from the plasmid works to bring about a larger immune response than the antigen alone, i.e. the leukotoxin works as a carrier protein.

A; Reference number: A43834; MUID:92267623

A; Accession: A43834

A; Accession: A43834

A; Molecule type: DNA

A; Residues: 1-956 <BUR>
A; Experimental source: isolate 3714

A; Note: sequence extracted from NCBI backbone (NCBIN:104212, NCBIP:10421:
C; Comment: This organism causes acute fatal septicemia in young pigs.
C; Function:
A; Description: attacks cell membranes and causes cell lysis
C; Superfamily: hemolysin A; hemolysin A homology
C; Keywords: calclum binding; cytolysis; exotoxin; hemolysis; lipoprotein; P; 243-787/Domain: hemolysin A homology CHLYA;
F; 719-901/Region: 9-residue repeats (G-G-X-G-[DN]-D-X-[LYTYF]-X)
F; 557/Binding site: palmitate (Lys) (covalent) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            B

J. Cell Biol. 22, 87-97, 1983
A; Title: Transport of hemolysin by Escheric
A; Reference number: 141280
A; Reference number: 141280
A; Status: translated from GB/EMBL/DDBJ
A; Molecule type: DNA
A; Residues: 1, 'T', 3, 'V', 5, 'T', 7-44 <RES>
A; Cross-references: GB:MZ9173; NID:g146337;
A; Gene: hlyA
C; Genettcs:
A; Gene: hlyA
C; Function: attacks blood cell membranes
C; Superfamily: hemolysin A; hemolysin A hom
C; Keywords: calcium binding; cytolysis; exception: 9-residue repeats (G-G-X:F;563,689/Binding site: palmitate (Lys) (cc

N.Title: Molecular analysis of the plasmid-encoded hemolysin of Reference number: I41077; MUID:95172699

A.Accession: I41078

A.Status: preliminary; translated from GB/EMBL/DDBJ

A.Molecule type: DNA

A.Residues: 1-998 <RESS

A.Cross-references: EMBL:X79839; NID:g860924; PIDN:CAA56234.1; PC:Superfamily: hemolysin A; hemolysin A homology

                                                 preparations are bacterial preparations comprising one or more isolated and purified strains of a microorganism that produces one or more RTX toxins, where the strains have at least one cell-associated RTX toxin. The preparations are used for production of vaccines for the prophylaxis and treatment of infectious diseases caused by microorganisms that produce RTX toxins, where the strains have been attenuated or
                                                                                                                                  AAW22151-W22161 represent A. pleuropneumoniae RTX (repeat in toxins) toxins. These sequence are encoded by the apxICA, apxIBD, apxIIAB°C, apxIIIABCD genes (see AAT73217-T73220), and can be expressed by microorganisms used in the presentations of the invention. The
